(57) Abstract: The present invention relates to ketoamide and ketoester compounds of Formula (I): where W is -NH- or -O-, or stereoisomeric forms, stereoisomeric mixtures, or pharmaceutically acceptable salt forms thereof, which are useful as inhibitors of HCV NS3 protease, and to pharmaceutical compositions and diagnostic kits comprising the same, and methods of using the

same for treating viral infection or as an assay standard or reagent.

#### TITLE

Alpha-Ketoamide Inhibitors of Hepatitis C Virus NS3
Protease

## FIELD OF THE INVENTION

The present invention relates generally to a novel class of alpha-ketoamides which are useful as serine protease inhibitors, and more particularly as Hepatitis C virus NS3 protease inhibitors. This invention also relates to pharmaceutical compositions comprising these compounds and methods of using the same.

## 15 BACKGROUND OF THE INVENTION

Hepatitis C virus (HCV) is the major cause of transfusion and community-acquired non-A, non-B hepatitis worldwide. Approximately 2% of the world's population are infected with the virus. In the Unites States, hepatitis C represents approximately 20% of 20 cases of acute hepatitis. Unfortunately, self-limited hepatitis is not the most common course of acute HCV infection. In the majority of patients, symptoms of acute hepatitis resolve, but alanine aminotransferase (a liver enzyme diagnostic for liver damage) levels often 25 remain elevated and HCV RNA persists. Indeed, a propensity to chroninicity is the most distinguishing characteristic of hepatitis C, occurring in at least 85% of patients with acute HCV infection. The factors that lead to chronicity in hepatitis C are not well defined. 30 Chronic HCV infection is associated with increased incidence of liver cirrhosis and liver cancer. No vaccines are available for this virus, and current treatment is restricted to the use of alpha interferon, which is effective in only 15-20% of patients. Recent clinical studies have shown that combination therapy of alpha interferon and ribavirin leads to sustained

efficacy in 40% of patients (Poynard, T. et al. Lancet 1998, 352, 1426-1432.). However, a majority of patients still either fail to respond or relapse after completion of therapy. Thus, there is a clear need to develop more effective therapeutics for treatment of HCV-associated 10 hepatitis.

HCV is a positive-stranded RNA virus. Based on comparison of deduced amino acid sequence and the extensive similarity in the 5' untranslated region, HCV has been classified as a separate genus in the Flaviviridae family, which also includes flaviviruses such as yellow fever virus and animal pestiviruses like bovine viral diarrhea virus and swine fever virus. All members of the Flaviviridae family have enveloped virions that contain a positive stranded RNA genome encoding all known virus-specific proteins via translation of a single, uninterrupted, open reading frame.

15

20

25

35

Considerable heterogeneity is found within the nucleotide and encoded amino acid sequence throughout the HCV genome. At least six major genotypes have been characterized, and more than 50 subtypes have been described. The major genotypes of HCV differ in their distribution worldwide, and the clinical significance of the genetic heterogeneity of HCV remains elusive despite 30 numerous studies of the possible effect of genotypes on pathogenesis and therapy.

The RNA genome is about 9.6 Kb in length, and encodes a single polypeptide of about 3000 amino acids. The 5' untranslated region contains an internal ribosome entry site (IRES), which directs cellular ribosomes to the correct AUG for initiation of translation. As was determined by transient expression of cloned HCV cDNAs, the precursor protein is cotranslationally and posttranslationally processed into at least 10 viral

structural and nonstructural (NS) proteins by the action of a host signal peptidase and by two distinct viral proteinase activities. The translated product contains the following proteins: core-E1-E2-p7-NS2-NS3-NS4A-NS4B-NS5A-NS5B.

The N-terminal portion of NS3 functions as a proteolytic enzyme that is responsible for the cleavage of sites liberating the nonstructural proteins NS4A, NS4B, NS5A, and NS5B. NS3 has further been shown to be a serine protease. Although the functions of the NS proteins are not completely defined, it is known that NS4A is a protease cofactor and NS5B is an RNA polymerase involved in viral replication. Thus agents that inhibit NS3 proteolytic processing of the viral polyprotein are expected to have antiviral activity.

There are several patents which disclose HCV NS3 protease inhibitors. WO98/17679 describes peptide and peptidomimetic ihibitors with the following formula: U-E8-E7-E6-E5-E4-NH-CH(CH<sub>2</sub>G<sup>1</sup>)-W<sup>1</sup>, where W is one of a variety of electrophilic groups, including boronic acid or ester. E4 represents either an amino acid or one of a series of peptidomimetic groups, the sythesis of which are not exemplified. HCV protease inhibitors described in the present case are not covered.

Based on the large number of persons currently
infected with HCV and the limited treatments available,
it is desirable to discover new inhibitors of HCV NS3
protease.

## **DEFINITIONS**

The compounds herein described have asymmetric centers. Compounds of the present invention containing an asymmetrically substituted atom may be isolated in optically active or racemic forms. It is well known in the art how to prepare optically active forms, such as 25 by resolution of racemic forms or by synthesis from optically active starting materials. Geometric isomers of double bonds such as olefins and C=N double bonds can also be present in the compounds described herein, and all such stable isomers are contemplated in the present 30 invention. Cis and trans geometric isomers of the compounds of the present invention are described and may be isolated as a mixture of isomers or as separated isomeric forms. All chiral, diastereomeric, racemic forms and all geometric isomeric forms of a structure 35 are intended, unless the specific stereochemistry or isomeric form is specifically indicated. All processes used to prepare compounds of the present invention and

5 intermediates made therein are considered to be part of the present invention.

10

15

The term "substituted," as used herein, means that any one or more hydrogens on the designated atom is replaced with a selection from the indicated group, provided that the designated atom's normal valency is not exceeded, and that the substitution results in a stable compound. When a substituent is keto (i.e., =0), then 2 hydrogens on the atom are replaced. Keto substituents are not present on aromatic moieties. When a ring system (e.g., carbocyclic or heterocyclic) is said to be substituted with a carbonyl group or a double bond, it is intended that the carbonyl group or double bond be part (i.e., within) of the ring.

The present invention is intended to include all isotopes of atoms occurring in the present compounds. Isotopes include those atoms having the same atomic number but different mass numbers. By way of general example and without limitation, isotopes of hydrogen include tritium and deuterium. Isotopes of carbon include C-13 and C-14.

When any variable (e.g., R<sup>1a</sup>) occurs more than one time in any constituent or formula for a compound, its definition at each occurrence is independent of its definition at every other occurrence. Thus, for example, if a group is shown to be substituted with 0-3 R<sup>1a</sup>, then said group may optionally be substituted with up to three R<sup>1a</sup> groups and R<sup>1a</sup> at each occurrence is selected independently from the definition of R<sup>1a</sup>. Also, combinations of substituents and/or variables are permissible only if such combinations result in stable compounds.

When a bond to a substituent is shown to cross a bond connecting two atoms in a ring, then such substituent may be bonded to any atom on the ring. When

5 a substituent is listed without indicating the atom via which such substituent is bonded to the rest of the compound of a given formula, then such substituent may be bonded via any atom in such substituent.

Combinations of substituents and/or variables are permissible only if such combinations result in stable compounds.

As used herein, "alkyl" or "alkylene" is intended to include both branched and straight-chain saturated aliphatic hydrocarbon groups having the specified number of carbon atoms. For example, "C1-C10 alkyl" (or alkylene), is intended to include C1, C2, C3, C4, C5, C6, C7, C8, C9, and C10 alkyl groups. Additionally, for example, "C1-C6 alkyl" denotes alkyl having 1 to 6 carbon atoms. Examples of alkyl include, but are not limited to, methyl, ethyl, n-propyl, i-propyl, n-butyl, i-butyl, sec-butyl, t-butyl, n-pentyl, n-hexyl, 2-methylbutyl, 2-methylpentyl, 2-ethylbutyl, 3-methylpentyl, and 4-methylpentyl.

"Alkenyl" or "alkenylene" is intended to include

25 hydrocarbon chains of either a straight or branched
configuration having the specified number of carbon
atoms and one or more unsaturated carbon-carbon bonds
which may occur in any stable point along the chain.
For example, "C2-C6 alkenyl" (or alkenylene), is

30 intended to include C2, C3, C4, C5, and C6 alkenyl
groups. Examples of alkenyl include, but are not limited

to, ethenyl, 1-propenyl, 2-propenyl, 2-butenyl, 3-butenyl, 2-pentenyl, 3, pentenyl, 4-pentenyl, 2-hexenyl, 3-hexenyl, 4-hexenyl, 5-hexenyl, 2-methyl-2-propenyl, 4-methyl-3-pentenyl, and the like.

"Alkynyl" or "alkynylene" is intended to include hydrocarbon chains of either a straight or branched configuration and one or more carbon-carbon triple bonds which may occur in any stable point along the chain.

The phrase "pharmaceutically acceptable" is employed herein to refer to those compounds, materials, compositions, and/or dosage forms which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of human beings and animals without excessive toxicity, irritation, allergic response, or other problem or complication, commensurate with a reasonable benefit/risk ratio.

As used herein, "pharmaceutically acceptable salts" refer to derivatives of the disclosed compounds wherein the parent compound is modified by making acid or base salts thereof. Examples of pharmaceutically acceptable salts include, but are not limited to, mineral or organic acid salts of basic groups such as amines; and alkali or organic salts of acidic groups such as carboxylic acids. The pharmaceutically acceptable salts include the conventional non-toxic salts or the

quaternary ammonium salts of the parent compound formed, for example, from non-toxic inorganic or organic acids. For example, such conventional non-toxic salts include those derived from inorganic acids such as hydrochloric, hydrobromic, sulfuric, sulfamic, phosphoric, and nitric; and the salts prepared from organic acids such as acetic, propionic, succinic, glycolic, stearic, lactic, malic, tartaric, citric, ascorbic, pamoic, maleic, hydroxymaleic, phenylacetic, glutamic, benzoic, salicylic, sulfanilic, 2-acetoxybenzoic, fumaric, toluenesulfonic, methanesulfonic, ethane disulfonic, oxalic, and isethionic.

The pharmaceutically acceptable salts of the present invention can be synthesized from the parent compound which contains a basic or acidic moiety by conventional chemical methods. Generally, such salts 20 can be prepared by reacting the free acid or base forms of these compounds with a stoichiometric amount of the appropriate base or acid in water or in an organic solvent, or in a mixture of the two; generally, nonaqueous media like ether, ethyl acetate, ethanol, 25 isopropanol, or acetonitrile are preferred. Lists of suitable salts are found in Remington's Pharmaceutical Sciences, 17th ed., Mack Publishing Company, Easton, PA, 1985, p. 1418, the disclosure of which is hereby incorporated by reference. 30

Since prodrugs are known to enhance numerous desirable qualities of pharmaceuticals (e.g., solubility, bioavailability, manufacturing, etc.) the compounds of the present invention may be delivered in prodrug form. Thus, the present invention is intended to cover prodrugs of the presently claimed compounds, methods of delivering the same and compositions containing the same. "Prodrugs" are intended to include any covalently bonded carriers which release an active

parent drug of the present invention in vivo when such 5 prodrug is administered to a mammalian subject. Prodrugs of the present invention are prepared by modifying functional groups present in the compound in such a way that the modifications are cleaved, either in routine manipulation or in vivo, to the parent compound. 10 Prodrugs include compounds of the present invention wherein a hydroxy, amino, or sulfhydryl group is bonded to any group that, when the prodrug of the present invention is administered to a mammalian subject, it cleaves to form a free hydroxyl, free amino, or free 15 sulfhydryl group, respectively. Examples of prodrugs include, but are not limited to, acetate, formate and benzoate derivatives of alcohol and amine functional groups in the compounds of the present invention.

"Stable compound" and "stable structure" are meant to indicate a compound that is sufficiently robust to survive isolation to a useful degree of purity from a reaction mixture, and formulation into an efficacious therapeutic agent.

25 "Therapeutically effective amount" is intended to include an amount of a compound of the present invention or an amount of the combination of compounds claimed effective to inhibit HCV infection or treat the symptoms of HCV infection in a host. The combination of compounds is preferably a synergistic combination. 30 Synergy, as described for example by Chou and Talalay, Adv. Enzyme Regul. 1984, 22, 27-55, occurs when the effect (in this case, inhibition of the desired target) of the compounds when administered in combination is greater than the additive effect of the compounds when 35 administered alone as a single agent. In general, a synergistic effect is most clearly demonstrated at suboptimal concentrations of the compounds. Synergy can be in terms of lower cytotoxicity, increased antiviral

5 effect, or some other beneficial effect of the combination compared with the individual components.

present invention can be synthesized using the methods
described below, together with synthetic methods known
in the art of synthetic organic chemistry, or variations
15 thereon as appreciated by those skilled in the art.
Preferred methods include, but are not limited to, those
described below. All references cited herein are hereby
incorporated in their entirety herein by reference.

The novel compounds of this invention may be 20 prepared using the reactions and techniques described in this section. The reactions are performed in solvents appropriate to the reagents and materials employed and are suitable for the transformations being effected. Also, in the description of the synthetic methods 25 described below, it is to be understood that all proposed reaction conditions, including choice of solvent, reaction atmosphere, reaction temperature, duration of the experiment and workup procedures, are 30 chosen to be the conditions standard for that reaction, which should be readily recognized by one skilled in the It is understood by one skilled in the art of organic synthesis that the functionality present on various portions of the molecule must be compatible with the reagents and reactions proposed. Such restrictions to the substituents which are compatible with the reaction conditions will be readily apparent to one skilled in the art and alternate methods must then be used.

A series of α-hydroxyesters and α-hydroxyamides of formula 5 are prepared by the method outlined in Scheme 1. Amino acid 1, wherein Z" is an amino protecting group, is treated with (cyanomethylene)tripheneylphosphorane to give cyano keto phosphorane 2. #### Example A1

N-(2-pyrazinylcarbonyl)-L-leucyl-L-isoleucyl-3-cyclohexyl-L-alanyl-2-oxo-(3 S)-3-amino pentanoylglycine

Step (Ala): At 0°C, DIEA (12.1Ml, 69.5 mmol) was added to the suspension of Ph<sub>3</sub>PCH<sub>2</sub>CNCl in CH<sub>2</sub>Cl<sub>2</sub>. The suspension turned to clear. The aminobutyric acid (15.0g, 63.2 mmol) was added followed by addition of EDCI (12.7g, 66.4 mmol) and DMAP (0.77g, 6.32 mmol). The resulted mixture was stirred at 0°C for 2h and at rt over night. Most of the solvent was evaporated and the residue was chromatographed on silica gel (50-60% EtOAc:Hexane). The product (Scheme 1, 2) was obtained as a white solid 22.7g in 69% yield. MS found (M+1)+521.3

35

Step (Alb): The ylide obtained from Step(Ala) (10g, 19.2 mmol) was dissolved in  $CH_2Cl_2$  (200 mL) and the mixture was cooled to  $-78^{\circ}C$ . To this mixture at  $-78^{\circ}C$  was purged  $O_3$  until the color changed to blue. Excess

5 O<sub>3</sub> was removed by purging N<sub>2</sub> into the mixture. The solution of Gly-OtBu hydrochloride (3.54g, 21.1 mmol), pretreated with DIEA and precooled) in CH<sub>2</sub>Cl<sub>2</sub> was added at -78°C to the above reaction mixture and stirred at -78°C for 30 min, then warmed to rt. Solvent was evaporated and the residue was chromatographed on silica gel (20-50% EtOAc:hexane). The α-ketoamide (Scheme 1, 3) was obtained in 58% yield as an oil (4.25g). MS found (M+Na)+ 401.1. Similarly, the reaction mixture can be quenched with methanol instead of Gly-OtBu to provide the corresponding α-ketoester (Scheme 1, 3a).

Step (A1c): To a solution of ketoamide obtained from Step (A1b) (0.23g, 0.61 mmol) in THF (10 mL) at 0°C was added sodium borohydride (42mg, 1.22mmol) in portions.

- 20 After stirring at 0°C for 30 min, the reaction mixture was quenched with acetone. Most of the solvent was evaporated and the residue was dissolved in EtOAc, washed with  $\rm H_2O$  and brine. Chromatography on silica gel (40% EtOAc in hexane) yielded 124 mg  $\alpha$ -hydroxyamide
- 25 (Scheme 1, 4) as a colorless oil (53%). MS found (M+1)+381.2.

Step (Ald): The α-hydroxyamide obtained from Step (Alc) (124 mg, 0.326 mmol) was dissolved in MeOH (50 mL) and Pd/C 10mg) was added. The mixture was hydrogenated under 1 atm. for 40 min. The reaction mixture was filtered and concentrated. The amine (Scheme 1, 5) was obtained in 99% yield as a white solid 82 mg. MS found (M+1)+ 247.3. Similarly, the α-ketoester from (Alb) was

35 converted to  $\alpha$ -hydroxyester (Scheme 1, **5a**) via step (Alc).

5 Step (Ale): DCC (3.99g, 19.3 mmol, 1.2 eq) was added to a solution of 2-pyrazine carboxylic acid (2.0g, 16.1 mmol) and N-hydroxysuccinimide (1.95g, 16.9 mmol, 1.05eq) in 100mL THF at 0°C. The mixture was stirred at rt over night. The reaction mixture was filtered,

- 10 concentrated and dried. The product was obtained in 91% yield as a solid (Scheme 4, 17).
  - Step (A1f): At 0°C under  $N_2$ , DIEA (13.3mL, 76.13 mmol) was added to a solution of material from Step (A1e)
- 15 (10g, 45.2 mmol) and leucine (5.93g, 45.3 mmol) in 120 mL DMF. After addition, the resulted mixture was stirred at rt over night. The mixture was diluted with 200 mL of EtOAc, washed with 1N HCl (2x30 mL), H<sub>2</sub>O (2x50 mL) and brine, and dried over MgSO<sub>4</sub>. The solvent was
- removed and dried on vacuum to provide a white solid as pure product (95%) (Scheme 4, 19). MS found (M-1)-219.
- Step (Alg): Following a procedure analogous to Step

  (Ale), the material from Step (Alf) (1.0g, 4.5 mmol) was treated with N-hydroxysuccinimide (530 mg, 4.5 mmol), providing the desired product as a white solid (1.28g, 90%) (Scheme 4, 20).
- 30 Step (Alh): Following a procedure analogous to Step (Alf), the succinimide ester of N-Boc isoleucine (10g, 30.45 mmol) was treated with cyclohexylalanine (6.32g, 30.45 mmol) in the presence of DIEA in DMF, providing the desired product (Scheme 4, 23) as a white solid 35 (95%). MS found (M+1)+ 385.3.
  - Step (Ali): The material from Step (Alh) (1.0g, 2.6 mmol) was treated with 4M HCl in dioxane for 2h at rt. Solvent was evaporated and the residue was dried.

Following a procedure analogous to Step (Alf), the material from above was treated with the material from Step (Alg) (0.83g, 2.6 mmol) in the presence of DIEA in DMF, providing the desired product (Scheme 4, 24) as a white solid (1.16g, 89%). MS found (M+1)+ 504.3.

10

Step (Alj): To a solution of the above material from Step (A1i) (1g, 1.99 mmol) in 100mL of DMF at  $0^{\circ}$ C was added BOP (1.3g, 2.98 mmol) and DIEA (0.52 mL, 2.98  $\,$ mmol). The mixture was stirred at this temp. for 20 min. 20 Example A50

N-(2-pyrazinylcarbonyl)-L-leucyl-L-isoleucyl-3-cyclohexyl-L-alanyl-5,5-difluoro-2-oxo-(3S)-3-aminopentanoylglycine

- Step (A50a): To a suspension of KOtBu (3.55g, 31.7mmol) in 15mL  $CH_2Cl_2$  was added N-CBZ-phosphonolycine trimethyl ester (9.46g, 28.5mmol) at -78°C under  $N_2$ . This mixture was stirred for 15min at this temperature and 2,2-difluoroacetaldehyde ethyl hemiacetal (4.0g, 31.7mmol)
- was added slowly. The resulted mixture was warmed up to room temperature and stirred overnight. Most solvent was removed and the residue was dissolved in ethyl acetate. The mixture was washed with cold water, dried over magnesium sulfate and concentrated. Flash
- chromatography (10-15% EtOAc/Hexane) gave the desired alkene (1.97g, 24%) (Scheme 3, 11) as a clear oil (4:1 mixture of Z:E isomers). (M+1)+ 286.3.

5 Step (A50b): A mixture the material from Step (A50a) (0.90g, 3.16mmol) and of (+)-1,2-bis((2S,5S)-2,5-diethyl-phospholano)benzene-(cyclooctadiene)rhodium(I) trifluoromethanesulfonate ([Rh(COD)(S,S-di-Ethyl-DUPHOS)]+CF<sub>3</sub>SO<sub>3</sub>-) (25mg, 0.03mmol, 1 mol%) in 20mL MeOH was hydrogenated at 50psi for 15h. After evaporation of solvent, the residue was dissolved in 30% EtOAc/Hexane and the solution was passed through a pad of silica gel to remove trace amount of the catalyst. Evaporation of solvent yielded the desired compound (Scheme 3, 12) as a crystalline solid (0.91g, 100%).

Step (A50c): To a solution of the material from Step (A50b) (1.95g, 5.23mmol) in 50mL  $CH_2Cl_2$  under  $N_2$  was added dropwise 5.49mL DIBAL (1.0M solution in  $CH_2Cl_2$ ,

- 5.49mmol) at -78°C over 15min. After stirring at this temperature for 2h, the mixture was quenched with 10mL 5% potassium hydrogen sulfate solution. Then the mixture was warmed up to room temperature, diluted with CH<sub>2</sub>Cl<sub>2</sub>, washed with KHSO<sub>4</sub>, NaHCO<sub>3</sub> and brine, dried over
- NaSO<sub>4</sub> and concentrated. Flash chromatography (15-30% EtOAc/Hexane) afforded 1.20g (89%) of the desired aldehyde (Scheme 3, 13) as a white solid.

Step (A50d): Butyl lithium (2.5M solution in hexane,
4.1mL, 10.3mmol) was added dropwise to a solution of
tris(methylthio)methane (1.58g, 10.3mmol) in 20mL THF at
-64°C and the mixture was stirred at this temperature
for 20min. Then a solution of 0.66g (2.57mmol) of the
material from Step (A50c)in 5.0mL THF was added dropwise
to the above mixture over 10min. The resulting mixture
was stirred at -30°C and warmed up to room temperature.
Then the reaction mixture was quenched with saturated
NH4Cl, and diluted with ethyl acetate. The organic

phase was separated and washed with 5% KHSO<sub>4</sub>, H<sub>2</sub>O, NaHCO<sub>3</sub>, brine, dried over NaSO<sub>4</sub> and concentrated. Flash chromatography (10-15% EtOAc/Hexane) yielded 0.90g (85%) of the desired product (Scheme 3, 14) as a clear oil (a mixture of two diasteromers).

10

Step (A50e): To a solution of 0.15g (0.36mmol) of the material from Step (A50d) in a mixed solvent of MeOH/H<sub>2</sub>O (12mL/1.0mL) were added 0.46g (1.69mmol) mercury(II) chloride and 0.12g (0.58mmol) mercury(II) oxide. The resulted suspension was stirred at room temperature for 2h. Then the reaction mixture was filtered through a pad of Celite and most of the solvent was removed. The residue was dissolved in ethyl acetate, and this mixture was washed with 70% ammonium acetate, saturated ammonium chloride, sodium bicarbonate and dilute NaCl solution, dried over magnesium sulfate and concentrated. Chromatography (30% EtOAc/Hexane) gave 0.11g (96%) of the desired product (Scheme 3, 15) as a clear oil (a mixture of two diasteromers).

25

The following Table 5 contains representative examples envisioned by the present invention. At the start of each table is one formula followed by species **21** through **267** demonstrating the intended substitution 10 of Z; species 1a through 1bw demonstrating the intended substitution of  $\mathbf{R}^1$ ; and species  $\mathbf{9a}$  through  $\mathbf{9n}$ demonstrating the intended substitution of R9. Each entry in each table is intended to be paired with each formula at the start of the table. For example, Example 15 100 in Table 5 is intended to be paired with each of formulae Z1, Z2, Z3, Z4, ... through Z67 of Table 4, as well as each of formulae 1a, 1b, 1c, 1d, ... through 1bw of Table 4, as well as each of formulae 9a, 9b, 9c, 9d, ... through 9n of Table 4; thereby representing Example 20 100-9a-1a-Z1, 100-9a-1a-Z2, 100-9a-1a-Z3, ... through 243-9n-1bw-Z67.

As an illustration, Example 100-9a-1a-Z1 is N-(2-pyrazinylcarbonyl)-L-leucyl-L-isoleucyl-3-cyclohexylalanyl-2-oxo-3-aminopentanoyl-N-(methylsulfonyl) glycinamide.

#### UTILITY

The compounds of Formula (I) are expected to inhibit the activity of Hepatitis C Virus NS3 protease. The NS3 protease inhibition is demonstrated using assays for NS3 protease activity, for example, using the assay described below for assaying inhibitors of NS3 protease. The compounds of Formula (I) are expected to show activity against NS3 protease in cells, as demonstrated by the cellular assay described below. Thus, the compounds of Formula (I) are potentially useful in the cure and prevention of HCV infections.

### Expression and Purification of NS3 Protease

The plasmid cf1SODp600, containing the complete coding region of HCV NS3 protease, genotype 1a, was 20 obtained from ATCC (database accession: DNA Seq. Acc. M62321, originally deposited by Chiron Corporation). PCR primers were designed that allow amplification of the DNA fragment encoding the NS3 protease catalytic domain (amino acids 1 to 192) as well as its two N-terminal fusions, a 5 amino acid leader sequence MGAQH (serving 25 as a expression tag) and a 15 amino acid His tag MRGSHHHHHHMGAQH. The NS3 protease constructs were cloned in the bacterial expression vector under the control of the T7 promoter and transformed in E. coli BL 21 (DE3) 30 cells. Expression of the NS3 protease was obtained by addition of 1 mM IPTG and cells were growing for additional 3h at 25°C. The NS3 protease constructs have several fold difference in expression level, but exhibit the same level of solubility and enzyme specific activity. A typical 10 L fermentation yielded 35 approximately 200 g of wet cell paste. The cell paste was stored at -80°C. The NS3 protease was purified based on published procedures (Steinkuhler C. et al. Journal

of Virology 70, 6694-6700, 1996 and Steinkuhler C. et al. Journal of Biological Chemistry 271, 6367-6373, 1996.) with some modifications. Briefly, the cells were resuspended in lysis buffer (10 mL/g) containing PBS buffer (20 mM sodium phosphate, pH 7.4, 140 mM NaCl),

- 10 50% glycerol, 10 mM DTT, 2% CHAPS and 1mM PMSF. Cell lysis was performed with use of microfluidizer. After homogenizing, DNase was added to a final concentration 70 U/mL and cell lysate was incubated at 4°C for 20 min. After centrifugation at 18,000 rpm for 30 min at 4°C
- supernatant was applied on SP Sepharose column (Pharmacia), previously equilibrated at a flow rate 3 mL/min in buffer A (PBS buffer, 10% glycerol, 3 mM DTT). The column was extensively washed with buffer A and the protease was eluted by applying 25 column volumes of a
- 20 linear 0.14 1.0 M NaCl gradient. NS3 containing fractions were pooled and concentrated on an Amicon stirred ultrafiltration cell using a YM-10 membrane. The enzyme was further purified on 26/60 Superdex 75 column (Pharmacia), equilibrated in buffer A. The sample was
- loaded at a flow rate 1 mL/min, the column was then washed with a buffer A at a flow rate 2 mL/min. Finally, the NS3 protease containing fractions were applied on Mono S 10/10 column (Pharmacia) equilibrated in 50 mM Tris.HCl buffer, pH 7.5, 10% glycerol and 1 mM DTT and
- operating at flow rate 2 mL/min. Enzyme was eluted by applying 20 column volumes of a linear 0.1 0.5 M NaCl gradient. Based on SDS-PAGE analysis as well as HPLC analysis and active site titration, the purity of the HCV NS3 1a protease was greater than 95%. The enzyme was
- 35 stored at  $-70^{\circ}$ C and diluted just prior to use.

#### Enzyme Assays

Concentrations of protease were determined in the absence of NS4a by using the peptide ester substrate Ac-

DED(Edans) EEAbuψ[COO]ASK(Dabcyl)-NH<sub>2</sub> (Taliani et al. Anal. Biochem. 240, 60-67, 1996.) and the inhibitor, H-Asp-Glu-Val-Val-Pro-boroAlg-OH and the inhibitor, H-Asp-Glu-Val-Val-Pro-boroAlg-OH and by using tight binding reaction conditions (Bieth, Methods Enzymol. 248, 59-85, 1995). Best data was obtained for an enzyme level of 50 nM. Alternately, protease (63 μg/ml) was allowed to react with 3 μM NS4a, 0.10 mM Ac-Glu-Glu-Ala-Cys-pNA, and varying level of H-Asp-Glu-Val-Val-Pro-boroAlg-OH (0-6 μM). Concentrations of protease were determined from linear plots of Activity vs. [inhibitor]. Molar concentrations of proteases were determined from the x-intercept.

 $K_m$  values were determined measuring the rate of hydrolysis of the ester substrate over a range of 20 concentrations from 5.0 to 100  $\mu M$  in the presence of 3 µM KKNS4a (KKGSVVIVGRIVLSGKPAIIPKK). Assay were run at 25°C, by incubating ~1 nM enzyme with NS4a for 5 min in 148 μl of buffer (50 mM Tri buffer, pH 7.0, 50% glycerol, 2% Chaps, and 5.0 mM DTT. Substrate (2.0  $\mu$ 1) in buffer was added and the reaction was allowed to 25 proceed for 15 min. Reactions were quenched by adding 3.0  $\mu L$  of 10% TFA, and the levels of hydrolysis were determined by HPLC. Aliquots (50 µL) were injected on the HPLC and linear gradients from 90% water, 10% 30 acetonitrile and 0.10 % TFA to 10% water, 90% acetonitrile and 0.10% TFA were run at a flow rate of 1.0 mL/min over a period of 30 min. HPLCs were run on a HP1090 using a Rainin 4.6  $\times$  250 mm C18 column (cat # 83-201-C) fluorescent detection using 350 and 500 nm as excitation and emission wavelengths, respectively. 35 Levels of hydrolysis were determined by measuring the area of the fluorescent peak at 5.3 min. 100% hydrolysis

of a 5.0 μM sample gave an area of 7.95 ±0.38 fluorescence units.). Kinetic constants were determined from the iterative fit of the Michaelis equation to the data. Results are consistent with data from Liveweaver Burk fits and data collected for the 12.8 min peak measured at 520 nm.

Enzyme activity was also measured by measuring the increase in fluorescence with time by exciting at 355 nm and measuring emission at 495 nm using a Perkin Elmer LS 50 spectrometer. A substrate level of 5.0  $\mu$ M was used for all fluorogenic assays run on the spectrometer.

#### Inhibitor Evaluation In vitro

15

20

Inhibitor effectiveness was determined by measuring enzyme activity both in the presence and absence of inhibitor. Velocities were fit to the equation for competitive inhibition for individual reactions of inhibitors with the enzyme using

 $v_i / v_o = [K_m (1 + I/K_i) + S] / [K_m + S].$ 

The ratio  $v_i$  /  $v_o$  is equal to the ratio of the

25 Michaelis equations for velocities measured in the presence  $(v_i)$  and absence  $(v_o)$  of inhibitor. Values of  $v_i$  /  $v_o$  were measured over a range of inhibitor concentrations with the aid of an Excel<sup>TM</sup> Spreadsheet. Reported  $K_i$  values are the average of 3-5 separate

30 determinations. Under the conditions of this assay, the IC<sub>50</sub> and  $K_i$ s are comparable measures of inhibitor effectiveness.

Using the methodology described above, compounds of the present invention were found to exhibit  $K_i$ 's of  $\leq 60$   $\mu$ M, thereby confirming the utility of the compounds of the present invention as effective NS3 protease inhibitors. Preferred compounds of the present invention have  $K_i$ 's of  $\leq 1$   $\mu$ M. More preferred compounds of the

5 present invention have  $K_i$ 's of  $\leq 100$  nM. Most preferred compounds of the present invention have  $K_i$ 's of  $\leq 10$  nM.

#### Inhibitor Evaluation in Cell Assay,

The following method was devised to assess 10 inhibitory action of test compounds on the HCV NS3 protease in cultured cells. Because it is not possible to efficiently infect cells with hepatitis C virus, an assay was developed based on co-expression in transfected cell lines of two plasmids, one is able to direct synthesis of the NS3 protease and the other to 15 provide a polypeptide analogous to a part of the HCV non-structural protein containing a single known peptide sequence highly susceptible to cleavage by the protease. When installed in cultured cells by one of a variety of 20 standard methods, the substrate plasmid produces a stable polypeptide of approximately 50KD, but when the plasmid coding for the viral protease is co-expressed, the enzymatic action of the protease hydrolyzes the substrate at a unique sequence between a cysteine and a 25 serine pair, yielding products which can be detected by antibody-based technology, eg, a western blot. Quantitation of the amounts of precursor and products can be done by scanning film auto-radiograms of the blots or direct luminescense-based emissions from the 30 blots in a commercial scanning device. The general organization of the two plasmids is provided in Scheme 6. The coding sequences for the NS3 protease and the substrate were taken from genotype 1a of HCV, but other genotypes, eg 2a, may be substituted with similar 35 results.

The DNA plasmids are introduced into cultured cells using electroporation, liposomes or other means. Synthesis of the protease and the substrate begin shortly after introduction and may be detected within a

few hours by immunological means. Therefore, test compounds are added at desired concentrations to the cells within a few minutes after introducing the plasmids. The cells are then placed in a standard CO2 incubator at 37°C, in tissue culture medium eg Dulbecco-10 modified MEM containing 10% bovine serum. After 6-48 hours, the cells are collected by physically scraping them from plastic dishes in which they have been growing, centrifuging them and then lysing about 106 of the concentrated cells in a minimal volume of buffered 15 detergent, eg 20  $\mu$ l of 1% sodium dodecyl sulfate in 0.10 M Tris-HC1, pH 6.5, containing 1% mercaptaethanol and 7% glycerol. The samples are then loaded onto a standard SDS polyacrylamide gel, the polypeptides separated by electrophoresis, and the gel contents then 20 electroblotted onto nitrocellulose or other suitable
